EDUCATION

Masters of Science

September 2024 – September 2026

University of New South Wales

- Data Science and Decisions (Computational), Sydney.

Bachelor of Technology

August 2019 - May 2023

Dayananda Sagar University

- Computer Science and Engineering, Bangalore.

WORK EXPERIENCE

Junior Software Developer

February 2023 - June 2024

CAI Info India Private Limited

- Engineered scalable ETL pipelines using Azure Data Factory and SQL Server to streamline data ingestion, reducing processing time by 14% and delivering reliable datasets for downstream analytics.
- Optimised stored procedures and SQL queries supporting reporting dashboards used by senior leadership, improving data retrieval performance and insight turnaround by 20%.
- Devised and maintained robust data validation layers to catch anomalies early in data lifecycle, increasing overall data accuracy across teams by 12%.
- Collaborated with cross-functional teams to integrate analytics-ready data models into operational systems, directly catalyzing real-time monitoring and decision-making.

PROJECTS

Species Distribution Modelling

May 2026 - July 2026

DATA5925 Team Project | UNSW

- Analysed presence-absence data for 8 reptile species across 641 NSW survey plots, identifying severe class imbalance and relationships between environmental and spatial predictors.
- Built a preprocessing and modelling pipeline in Python, Pandas and Scikit-learn, then developed and tuned single-species and joint-species Regularised Logistic Regression models using L2 regularisation, class weighting, cross-validation and Optuna.
- Concluded that single-species RLR generally provided stronger species-level discrimination, while joint modelling improved some probability-based measures but did not consistently improve predictions for rare species.

Customer Loyalty & Retention Analytics

March 2026 - June 2026

Team Project | UNSW

- Analysed transaction and loyalty data from 3,200+ customers across a multi-merchant loyalty program to understand purchasing patterns, merchant contribution, customer value and retention drivers.
- Used K-Means clustering to segment customers, logistic regression to identify retention predictors, and ANOVA and Chi-square testing to assess cross-merchant behaviour. The analysis found that transaction frequency, Net Promoter Score and program satisfaction significantly influenced retention, while retention increased from 66.5% for single-merchant customers to 87.5% for three-merchant customers.
- Recommendation was to Prioritise retention initiatives for low-engagement and single-merchant customers by encouraging cross-merchant usage, increasing transaction frequency and improving program satisfaction, while using customer segments to target high-value customers with personalised loyalty offers.

Formula 1 Project Independent Project

January 2026 - Present

- Built an end-to-end Formula 1 analytics project using Python, SQL, FastF1, Pandas, and Tableau to analyse race, qualifying, driver, and team performance.
- Cleaned and transformed multi-season race data and developed custom metrics to evaluate grid dependency, race position changes, pace, reliability, and consistency.
- Designed a SQL-based data warehouse and interactive Tableau dashboard to support season-level, race-level, and driver/team performance analysis.
- Published analytical findings through GitHub and Medium, demonstrating data analysis, visualisation, reproducible workflows, and data storytelling.

Beer Portfolio Optimisation Dashboard INFS5700 Team Project | UNSW

January 2026 - March 2026

- Built an interactive Power BI dashboard to analyse a national beer distribution dataset covering \$4.31M revenue, \$1.81M profit, 561K units sold, 150 SKUs, and 3,352 customers.
- Created portfolio performance insights across product categories, customer segments, regions, sales channels, review scores, ABV levels, and discount tiers.
- Recommended data-driven portfolio actions including promoting high-performing SKUs, expanding higher-margin channels, reducing low-performing products, and limiting excessive discounts.
- Used DAX measures and visual analysis to uncover relationships between pricing, ratings, and profitability, highlighting how higher-rated products and discount levels impacted overall margins.

TECHNICAL SKILLS

- Languages: Python, SQL, Java, C#.
- Tools & Technologies: ETL, Azure Data Factory, Databricks, Data Pipelines, Data Warehousing.
- Database: SQL Server, PL/SQL.
- Analytics & BI: Power BI, Tableau, DAX.
- Data Science: Machine Learning, Exploratory Data Analysis, Statistics.

EXTRACURRICULAR

- Organised coding events and peer-learning workshops, mentoring juniors and supporting a collaborative tech community.
- Supported Arc UNSW Food Hub operations, helping distribute 31,000kg+ of food and essentials to 800+ students weekly.
- Volunteered at the Parramatta Half Marathon and HYROX, supporting participant assistance, crowd flow, and event operations.
